rectification : 8-parameter transf.

83

Jan 31-4:23 PM

flowchart for rectification

84

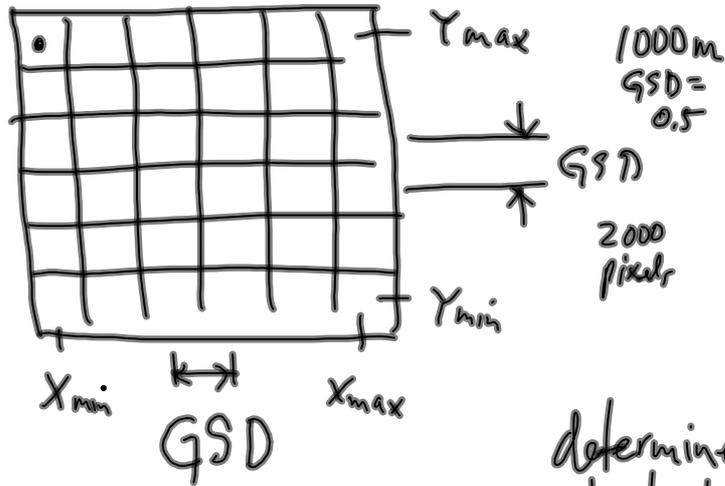

1. using GCP establish + est. GZI proj. model
8 parameters OR collinearity
2. specify extent (object space)
 $X_{min}, X_{max}, Y_{min}, Y_{max}$
3. GSD = ground sample distance
 dx, dy usually $dx = dy$
4. initialize output image with default intensity
and with req. number of rows + columns.
5. cycle through all pixels in output image
6. for each one compute $X^*Y^*(Z)$ + project into
source (input) image
7. interpolate intensity, store in output image
8. when done, write output image to file.

Jan 31-4:23 PM

initialize output image with default intensity
and req. number of rows & columns.
